BROOK KEBE PRIMARY EXAM		K.N. May 12, 2006	

Art Unit: 2823

DETAILED ACTION

Drawings

1. The drawings were received on April 16th, 2004. These drawings are acceptable.

EXAMINER'S AMENDMENT

2. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Peter A. Veytsman on May 11th, 2006.

3. The application has been amended as follows:

In the Claims:

Cancel dependent claims 3, 15, 26, 52, 64, and 75.

Change claim 1 to -- A method of fabricating a thin film transistor comprising the steps of: providing a gate over a substrate; providing a gate insulating layer over said gate and said substrate; providing an amorphous silicon layer having a first resistance over said gate insulating layer; providing an impurity on the surface of said amorphous silicon layer; forming a drain electrode and a source electrode separated by a channel region over a contact portion with said amorphous silicon layer; subsequently, removing said impurity from said channel region by exposing said channel region to hydrogen plasma and diffusing said impurity into said contact portion to form a contact layer within said amorphous silicon layer, wherein said

Art Unit: 2823

contact layer has a second resistance lower than said first resistance; and removing the impurity formed over the amorphous silicon layer in the channel region between the drain and source electrodes while retaining the impurity over the amorphous silicon layer surface contacted with drain and source region, so that the drain and source regions become a contact layer.—.

Change claim 13 to — A method of fabricating a thin film transistor comprising the steps of: providing a gate over a substrate; providing a gate insulating layer over said gate and said substrate; providing an amorphous silicon layer having a first resistance over said gate insulating layer; providing an impurity over said amorphous silicon layer, wherein said amorphous silicon layer does not contain said impurity; etching said silicon layer utilizing a common photoresist to form a drain electrode and a source electrode separated by a channel region over a contact portion with said amorphous silicon layer; subsequently, removing said impurity from said channel region by exposing said channel region to hydrogen plasma and diffusing said impurity into said contact portion to form a contact layer within said amorphous silicon layer, wherein said contact layer has a second resistance lower than said first resistance; and removing the impurity formed over the amorphous silicon layer in the channel region between the drain and source electrodes while retaining the impurity over the amorphous silicon layer surface contacted with drain and source region, so that the drain and source regions become a contact layer.—.

Change claim 24 to -- A method of fabricating a thin film transistor comprising the steps of: providing a gate over a substrate; providing a gate insulating layer over said gate and said substrate; providing an amorphous silicon layer having a first resistance over said gate insulating layer; providing an impurity on the surface of said amorphous silicon layer; providing a photoresist over said impurity and back exposing said photoresist utilizing said gate stack as a mask and developing a pattern substantially identical with that of said gate; removing said pattern and forming a drain electrode and a source electrode separated by a channel region over a contact portion with said amorphous silicon layer; subsequently, removing said impurity from said channel region by exposing said channel region to hydrogen plasma and diffusing said impurity into said contact portion to form a contact layer within said amorphous silicon layer, wherein said contact layer has a second resistance lower than said first resistance, and wherein essentially none of said impurity is diffused into said contact portion prior to said removing step; and removing the impurity formed over the amorphous silicon layer in the channel region between the drain and source electrodes while retaining the impurity over the amorphous silicon layer surface contacted with drain and source region, so that the drain and source regions become a contact layer.--.

Change claim 50 to --A method of fabricating a liquid crystal display (LCD) comprising the steps of: providing a plurality of thin film transistors arranged on a LCD substrate in a matrix form, each of said thin film transistors fabricated by the steps of: providing a gate over a substrate; providing a gate insulating layer over said gate and said substrate; providing an amorphous silicon layer having a first resistance over said gate insulating layer; providing an impurity on the surface of said amorphous

Art Unit: 2823

silicon layer, forming a drain electrode and a source electrode separated by a channel region over a contact portion with said amorphous silicon layer; subsequently, removing said impurity from said channel region by exposing said channel region to hydrogen plasma and diffusing said impurity into said contact portion to form a contact layer within said amorphous silicon layer, wherein said contact layer has a second resistance lower than said first resistance, and removing the impurity formed over the amorphous silicon layer in the channel region between the drain and source electrodes while retaining the impurity over the amorphous silicon layer surface contacted with drain and source region, so that the drain and source regions become a contact layer.—.

Change claim 62 to --A method of fabricating a liquid crystal display (LCD) comprising the steps of: providing a plurality of thin film transistors arranged on a LCD substrate in a matrix form, each of said thin film transistors fabricated by the steps of: providing a gate over a substrate; providing a gate insulating layer over said gate and said substrate; providing an amorphous silicon layer having a first resistance over said gate insulating layer; providing an impurity on the surface of said amorphous silicon layer, wherein said impurity does not diffuse into said amorphous silicon layer; etching said amorphous silicon layer utilizing a common photoresist to form a drain electrode and a source electrode separated by a channel region over a contact portion with said amorphous silicon layer; subsequently, removing said impurity from said channel region by exposing said channel region to hydrogen plasma and then diffusing said impurity into said contact portion to form a contact layer within said amorphous silicon layer, wherein said contact layer has a second resistance lower than said first resistance; and removing the impurity formed over the amorphous silicon layer in the channel region between the drain and

Art Unit: 2823

source electrodes while retaining the impurity over the amorphous silicon layer surface contacted with drain and source region, so that the drain and source regions become a contact layer.--.

Page 6

Change claim 73 to -- A method of fabricating a liquid crystal display (LCD) comprising the steps of: providing a plurality of thin film transistors arranged on a LCD substrate in a matrix form, each of said thin film transistors fabricated by the steps of: providing a gate over a substrate; providing a gate insulating layer over said gate and said substrate; providing an amorphous silicon layer having a first resistance over said gate insulating layer; providing an impurity over said amorphous silicon layer, wherein said amorphous silicon layer does not contain said impurity; providing a photoresist over said impurity and back exposing said photoresist utilizing said gate stack as a mask and developing a pattern substantially identical with that of said gate; removing said pattern and forming a drain electrode and a source electrode separated by a channel region over a contact portion with said amorphous silicon layer; subsequently, removing said impurity from said channel region by exposing said channel region to hydrogen plasma and diffusing said impurity into said contact portion to form a contact layer within said amorphous silicon layer, wherein said contact layer has a second resistance lower than said first resistance; and removing the impurity formed over the amorphous silicon layer in the channel region between the drain and source electrodes while retaining the impurity over the amorphous silicon layer surface contacted with drain and source region, so that the drain and source regions become a contact layer .--.

Allowable Subject Matter

4. Claims 1, 2, 5, 7, 8, 13, 14, 17, 19, 20, 24, 25, 28, 30, 31, 50, 51, 54, 56, 57, 62, 63, 66, 68, 69, 73, 74, 77, 79, and 80 are allowed over prior art of record.

Art Unit: 2823

Reasons For Allowance

5. The following is an examiner's statement of reasons for allowance:

After further search and consideration of applicants' argument filed on March 14th, 2006, it is determined that the prior art of record neither anticipates nor renders obvious the claimed subject matter of the instant application as a whole either taken alone or in combination, in particular, prior art of record does not teach "removing said impurity from said channel region by exposing said channel region to hydrogen plasma" as recited in independent claims 1, 13, 24, 50, 62, and 73.

Claims 2, 5, 7, 8, 14, 17, 19, 20, 25, 28, 30, 31, 51, 54, 56, 57, 63, 66, 68, 69, 74, 77, 79, and 80 are also allowed as being directly or indirectly dependent of the allowed independent base claims.

Conclusion

- 6. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
- 7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

US-6,624,051	09-2003	Ohtani et al.
US-6,444,508	09-2002	Tanabe et al.
US-6,214,684	04-2001	Shoji, Tatsumi
US-5,990,489	11-1999	Tashiro, Kazuaki

Art Unit: 2823

US-5,637,512 06-1997 Miyasaka et al.

US-5,591,989 01-1997 Miyasaka et al.

These references are related to method of fabricating thin film transistor but does not teach or suggest "removing said impurity from said channel region by exposing said channel region to hydrogen plasma" as recited in independent claims 1, 13, 24, 50, 62, and 73.

Correspondence

Any inquiry concerning this communication or earlier communications from the
examiner should be directed to Khiem D. Nguyen whose telephone number is (571) 2721865. The examiner can normally be reached on Monday-Friday (8:30 AM - 5:30 PM).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Matthew S. Smith can be reached on (571) 272-1907. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
